Guideline Status

This is the current release of the guideline.

Recommendations

Major Recommendations

The strength of the recommendation (strongly recommended, recommended, or no recommendation) and the quality of the evidence (1a–5b) are defined at the end of the "Major Recommendations" field.

1. It is recommended that for children with sleep onset latency, improving sleep hygiene and progressive relaxation may decrease sleep onset latency (Lacks et al., 1983 [2b]; Borkevec et al., 1979 [2b]).
   Note: Sleep hygiene would include regular bedtime and waking routines, association of bedroom with sleep, monitoring nighttime activities to promote sleep and limiting napping.

2. It is recommended that children aged 6-12 who are diagnosed with attention deficit hyperactivity disorder and children with developmental disorders benefit from the use of melatonin to improve sleep efficacy and sleep duration and to decrease sleep onset latency (Van Der Heijaden et al., 2007 [2a]; Hoebert et al., 2009 [4a]; Dodge & Wilson, 2001 [2b]; Armour & Paton, 2004 [5a]).

Management

Treatment

**Clinical Specialty**

Family Practice

Internal Medicine

Pediatrics

Sleep Medicine

**Intended Users**

Advanced Practice Nurses

Nurses
Guideline Objective(s)

To evaluate, among children with mental health diagnoses, if self-regulation techniques compared to as needed (PRN) sleep medications affects sleep quality at night during an inpatient hospital stay.

Target Population

Children aged 3-18 years old with mental health diagnoses, including attention deficit disorders, autism spectrum disorders or developmental delays receiving inpatient psychiatric mental health and/or behavioral care.

Interventions and Practices Considered

1. Self-regulation techniques that promote sleep hygiene and progressive relaxation.
2. Melatonin.

Major Outcomes Considered

- Sleep onset latency
- Sleep duration
- Number of night time awakenings

Methodology

Methods Used to Collect/Select the Evidence

Searches of Electronic Databases

Description of Methods Used to Collect/Select the Evidence

Search Strategy

Search terms included: sleep, relaxation, progressive muscular relaxation, mediation, calming techniques, breathing techniques, self-awareness, self-regulation, cranial-sacral massage, neuroaffective, melatonin, sleep aids, Benadryl, child, and psychiatry.

The databases searched include: MEDLINE, CINAHL, PsycINFO, Cochrane Database of Systematic Reviews, PubMed. The search was limited to articles that were printed in English, all dates inclusive through December 2010. A question was submitted to National Association of Children's Hospitals and Related Institutions, now known as Child Health Association, with no responses.

Number of Source Documents

Not stated.

See the original guideline document for the dimensions used for judging the strength of the recommendation.

Cost Analysis

A formal cost analysis was not performed and published cost analyses were not reviewed.
Method of Guideline Validation

Peer Review

Description of Method of Guideline Validation

This Best Evidence Statement has been reviewed against quality criteria by 2 independent reviewers from the Cincinnati Children's Hospital Medical Center (CCHMC) Evidence Collaboration.

Evidence Supporting the Recommendations

References Supporting the Recommendations

Type of Evidence Supporting the Recommendations

The type of supporting evidence is identified and graded for each recommendation (see the "Major Recommendations" field).

Benefits/Harms of Implementing the Guideline Recommendations

Potential Benefits

Improved sleep quality at night including decreased sleep onset latency, increased sleep duration and decreased number of night time awakenings

Potential Harms

Melatonin has rare possible side effects such as headache, increased seizure activity, increased asthma symptoms and a potential adverse effect on puberty development
Qualifying Statements

This Best Evidence Statement addresses only key points of care for the target population; it is not intended to be a comprehensive practice guideline. These recommendations result from review of literature and practices current at the time of their formulation. This Best Evidence Statement does not preclude using care modalities proven efficacious in studies published subsequent to the current revision of this document. This document is not intended to impose standards of care preventing selective variances from the recommendations to meet the specific and unique requirements of individual patients. Adherence to this Statement is voluntary. The clinician in light of the individual circumstances presented by the patient must make the ultimate judgment regarding the priority of any specific procedure.

Implementation of the Guideline

Description of Implementation Strategy

An implementation strategy was not provided.

None available

NGC Status
This NGC summary was completed by ECRI Institute on August 30, 2012.

Copyright Statement
This NGC summary is based on the original full-text guideline, which is subject to the following copyright restrictions:

Copies of this Cincinnati Children's Hospital Medical Center (CCHMC) Best Evidence Statement (BEST) are available online and may be distributed by any organization for the global purpose of improving child health outcomes. Examples of approved uses of the BEST include the following:

- Copies may be provided to anyone involved in the organization's process for developing and implementing evidence based care;
- Hyperlinks to the CCHMC website may be placed on the organization's website;
- The BEST may be adopted or adapted for use within the organization, provided that CCHMC receives appropriate attribution on all written or electronic documents; and
- Copies may be provided to patients and the clinicians who manage their care.

Notification of CCHMC at EBDMInfo@cchmc.org for any BEST adopted, adapted, implemented or hyperlinked by the organization is appreciated.
